About Martini

Introducing Martini, a modern, API-centric Integration Platform as a Service (iPaaS) for digital transformation. Martini includes everything you need to consume, publish and manage APIs, integrate cloud-based and on-premise applications, manage data, automate business processes, log transactions, and create reports. Some of the things customers do with Martini:

- **Integration**
 - Integrating SaaS applications
 - Integrating legacy and line-of-business applications
 - Integrating databases and other data sources
 - Hybrid integrations of cloud-based services with on-premise services
- **API design & management**
 - Design APIs using a visual API designer
 - Apply "API first" design principles with stakeholders getting involved in the design process before a single line of code is written implementing backend services
 - Secure APIs using industry standards such as OAuth2
 - Manage APIs usage limits
 - Monetize APIs by applying pricing rules and logging usage
 - Creating, consuming or publishing legacy SOAP services
- **Data management**
 - Extracting, transforming and loading (ETL) data
 - Validating data
 - Enriching data
 - Reading/writing to different file formats such as XML, JSON, YAML, CSV
- **Application development**
 - Creating line-of-business applications with low-code services that are composed of RESTful microservices by design
 - Modernizing legacy applications by creating new modern microservices with RESTful APIs and proxying the requests from the legacy application to those services through Martini
- **Business process automation**
 - Automating manual business processes
 - Creating workflows that are triggered by system events
- **Audit & reports**
 - Logging transactions into a search index so that they can be searched by keyword or filtered by facets
 - Auditing transactions for system errors and retrying failed transactions
 - Creating reports showing service usage, trends, or any facet of data logged to the search index
